

Quail- Kick Type Sod Cutter

“All that's required to operate the cutter is a simple kicking motion on the green cross bar while using the handles to push and direct the cutter's path.”

<http://quailsodcutter.com/>

- Prepare the lawn the day before you cut the sod. Mow the lawn to reduce the weight and volume of the sod. Insert a hand spade or screwdriver into the soil to make sure the top 2- or 3-inch layer is moist and soft. Water the lawn with a garden hose if the soil is dry and compacted.
- Put on gardening gloves and work shoes, and place the sod cutter at one end of the area you want to cut. Set the blade 1 to 2 inches deep to cut the root layer, or set it to skim the soil surface for inch-thick thatch removal.
- Press down on the handles to force the horizontal blade into the soil. Kick the crossbar that connects the handles to move the sod cutter forward, allowing the blade to slide under the grass and loosen the sod. Continue to push and kick the sod cutter forward across the area you want to cut. Keep the blade even to create long strips.
- Pull up the handles to remove the blade from the soil. Roll up the strips of sod and set them aside for disposal or turf repair in another area.

- Don't forget to clean the tool/blade before returning.
- Keep the protective blade sheath on while not in use and during transport.
