

Pullerbear Manufacturer instructions:

Step 1:

Isolate the stem of the plant that you want to remove and clear away or tamp down any grass or undergrowth in the vicinity of the stem.

For XL321 – adjust the metal pin to the appropriate size for shrub stem (1,2,3 inches).

Step 2:

Once you have positioned the Pullerbear and set the teeth into the flesh of the stem – push down on the handle. The roots will resist but the greater the resistance the tighter the bite.

Do not use any attachments, etc. for additional leverage.

Step 3:

Once the plant has been removed replace the sod over the hole that has been created.
